

Stainless Steel Wire

(AWS ER308)

The nominal composition (wt.-%) of this classification is 21 Cr, 10 Ni. Commercial specifications for filler and base metals vary in the minimum alloy requirements; consequently, the names 18-8, 19-9, and 20-10 are often associated with filler metals of this classification. This classification is most often used to weld base metals of similar composition, in particular, type 304.

Stainless Steel Wire

(AWS ER309)

The nominal composition (wt.-%) of this classification is 24 Cr, 13 Ni. Filler metals of this classification are commonly used for welding similar alloys in wrought or cast form. Occasionally, they are used to weld type 304 and similar base metals where severe corrosion conditions exist requiring higher alloy weld metal. They are also used in dissimilar metal welds.

Stainless Steel Wire

(AWS ER316)

The nominal composition (wt.-%) of this classification is 19 Cr, 12.5 Ni. This filler metal is used for welding type 316 and similar alloys. It has been used successfully in certain applications involving special base metals for high-temperature service. The presence of molybdenum provides creep resistance at elevated temperatures and pitting resistance in a chloride atmosphere.
